(54) Title: TELECOMMUNICATION SYSTEM WITH NON-(RE)ALLOCATABLE AND (RE)ALLOCATABLE TIMESLOTS

(57) Abstract: Telecommunication systems for providing telecommunication services via communication channels (50) with time-frame structures having at least two flexible timeslots which are (re)allocatable to an uplink or a downlink can be made more practical by introducing at least one fixed (non-(re)allocatable) uplink timeslot, at least one fixed (non-(re)allocatable) downlink timeslot, and by introducing according to a basic idea in said flexible timeslots a first number of timeslots with an uplink priority and a second number of timeslots with a downlink priority. Said at least one fixed uplink timeslot can be one fixed uplink timeslot, said at least one fixed downlink timeslot can be one fixed downlink timeslot, with said first and second number of timeslots coinciding, and with one kind of priority increasing and with the other kind of priority decreasing per timeslot. Alternatively, rules and/or interference detection results are used for defining (locations and/or priorities for) said first and second number of timeslots.
